## **Abstract:**

WO 9428959 A

The inhalation device comprises a container (1) for water and an inhalation agent, provided with a lid (2) having a central opening (3) for discharge of the steam vapour generated within the container and a number of smaller peripheral openings (4), for allowing air to enter the container. The water and the inhalation agent are vaporised together at a temp. between body and temp. and 65 degrees, the supplied outside air used to swirl the vaporised mixture.

Pref. the container is double-walled with water contained in the intermediate space (1c) and heated by a resistance heating wire supplied from the mains network or an electric battery. One or more thermostats may be used to regulate the vaporisation temp.

ADVANTAGE - Improved vaporisation characteristics for deep penetration into respiration system.

Dwg.1/10
